

# CXL Ready for Take-off

Charles Fan  
Co-founder & CEO

# CXL Enables Memory-Centric Computing

- Disaggregates memory from processors
- Enables
  - Memory expansion
  - Memory pooling
  - Memory sharing

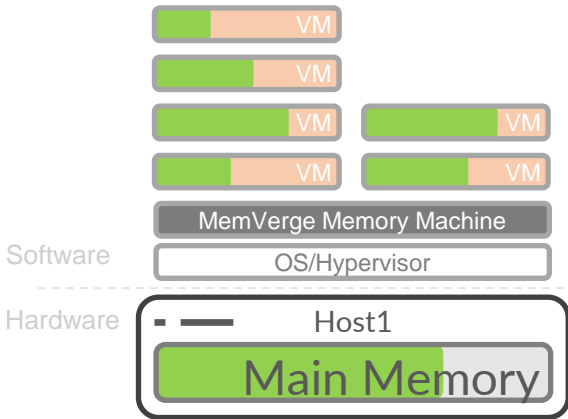

# Project Endless Memory

- 2 Intel Sapphire Rapids Servers
- 1 SK hynix Niagara Pooled Memory Development Platform (128GB Multi-host Single Logical Device)

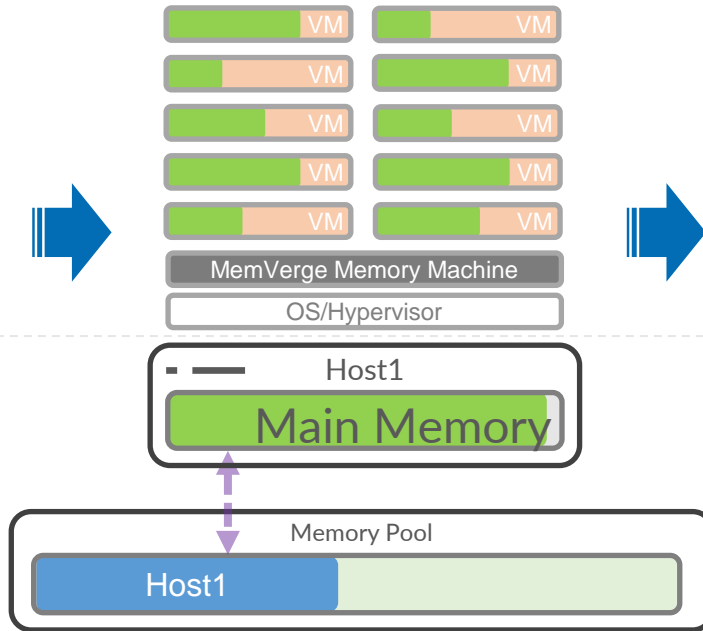

# No More Out-of-memory Errors

1. Host at 'steady-state' using Main Memory only

2. As high VM demand exhausts Main Memory, **Memory Machine** detects and dynamically provisions capacity from the memory pool

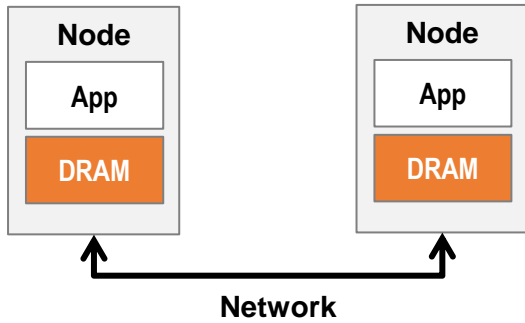

3. As VM demand diminishes, **Memory Machine** releases the memory back to the pool and returns to 'steady state'

Used Main Memory

Used Pool Memory

# The I/O Wall in Distributed Applications

**Serialization &  
Deserialization**

**Data Copies**

**Media Speed**

# CXL Makes Cross-node Shared Memory Possible!

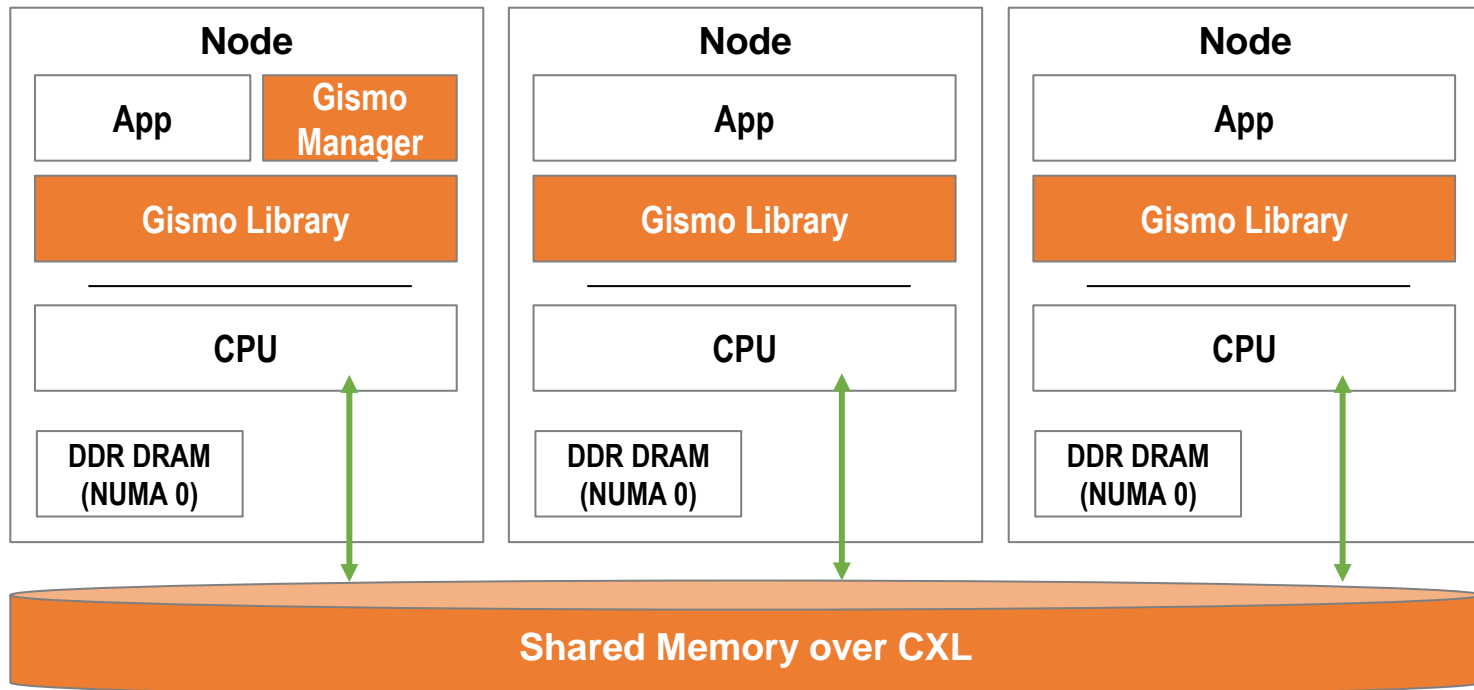

- Multiple nodes have direct memory access to the same CXL memory region
- Cache Coherence is part of CXL 3.0 hardware specification
- Software cache coherence can be implemented on top of CXL 2.0 hardware

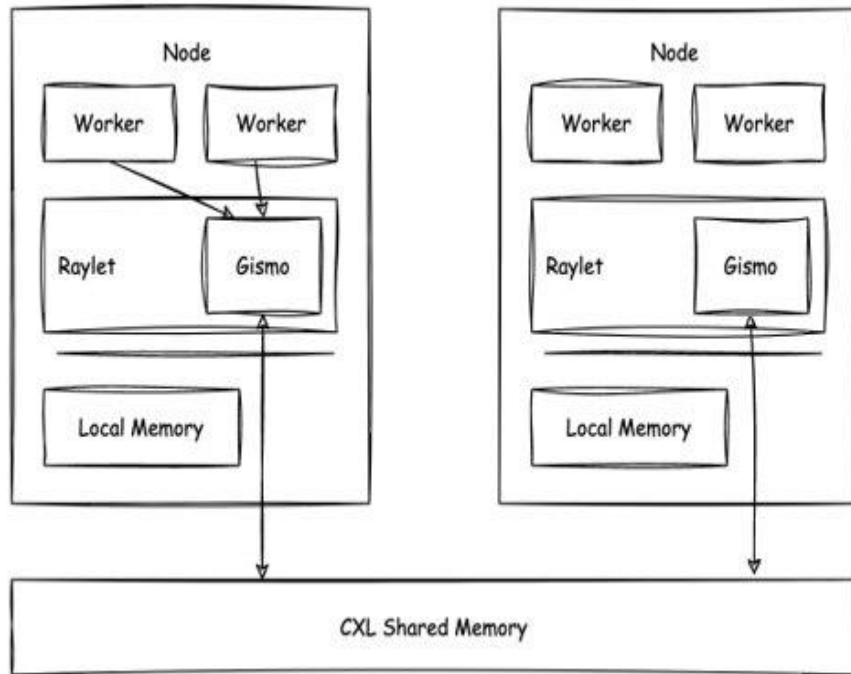

# Introducing Project Gismo

Global I/O-free Shared Memory Objects

# Use Case Example: Ray+Gismo

- **IO-free:** No more object serialization and transfer over network for remote object access
- **Zero Copy:** No more duplicate object copies on different nodes
- **No Spilling:** Reduce object spilling and data skewing because each node has access to the whole memory pool

# Shuffle Benchmark Results

	Baseline Ray	Ray + Gismo
Local Get 1GB object	0.4 sec	0.4 sec <b>CXL shared memory as fast as local memory</b>
Remote Get 1GB object	2.7 sec	0.4 sec <b>675% faster</b>
Shuffle 50GB 4 nodes, each 4 cores, 128 GB object store	515 sec	185 sec <b>280% faster</b>

\* Running in emulation environment
